## ABSTRACT

*This paper presents an AI-based graphical learning interface designed to enhance the acquisition of English grammar skills through interactive visual learning and intelligent feedback. Mastering English grammar is crucial for language proficiency, yet many learners find traditional grammar instruction challenging and disengaging due to complex rules and static exercises. The proposed system leverages artificial intelligence (AI) and a rich graphical user interface to transform grammar learning into a more personalized, engaging experience. The platform integrates natural language processing for real-time grammar analysis and error correction, as well as machine learning to adapt to each learner's pace and proficiency level. Users can interact with visual grammar exercises – such as drag-and-drop sentence constructions and graphical illustrations of grammar rules – and receive immediate corrective feedback and hints, thereby reinforcing understanding through practice. A pilot study with ESL learners demonstrated improved grammatical proficiency and sustained engagement when using the interface, compared to traditional methods. The system's architecture and features are discussed, including its core AI components and user-centric design, followed by an evaluation of learning outcomes. Results indicate that combining AI-driven feedback with a graphical learning approach can significantly improve grammar mastery and learner motivation. This research provides insights into how innovative educational technology can bridge existing gaps in grammar education, offering a learner-centric tool that makes grammar practice both effective and enjoyable.*

## 1. INTRODUCTION

### 1.1 Background

English grammar is a foundational component of language proficiency, but learning grammar rules and structures has long been considered tedious and difficult for many students. Traditional approaches, such as textbook exercises and lectures, often fail to engage learners, resulting in low retention and understanding of grammatical concepts. Research indicates that complicated grammar rules and lack of interactive practice contribute to this challenge. Educators have attempted various methods – from simplified rule explanations to rote drills – yet a significant gap remains in making grammar learning both accessible and interesting. In recent years, **artificial intelligence** and digital platforms have emerged as promising tools to bridge this gap. AI-driven applications can provide **personalized learning experiences**, adapting to the learner's needs, and offering features like instant feedback and guided practice. Notably, the integration of AI in language education has already shown benefits in related areas; for example, intelligent tutoring systems like AutoTutor have successfully engaged students in learning through mixed-initiative dialogue interactions [1]. These advancements highlight the potential for AI to transform grammar instruction from a passive, one-size-fits-all model to an interactive, **learner-centered** experience. Additionally, incorporating **graphical learning interfaces** – visual and interactive elements in software – is known to increase student engagement and comprehension by illustrating abstract concepts in a concrete manner. This background underpins the motivation for developing an AI-based graphical interface dedicated to English grammar learning.

### 1.2 Need for Innovation

Despite the availability of grammar textbooks and online exercises, learners often receive limited feedback on their mistakes and little personalization in the learning process. In conventional classrooms or self-study methods, feedback on grammar exercises might be delayed (e.g., waiting for a teacher's corrections) or generic, hindering timely improvement. Moreover, traditional grammar teaching tends to be **one-directional** – students memorize rules and complete assignments – which can lead to disengagement. There is a clear need for

innovative solutions that address these shortcomings. **AI-based educational systems** offer a way to provide **immediate, tailored feedback** and adapt to individual learning curves, something not feasible at scale with purely human instruction. Prior studies have shown that AI-powered language learning applications can deliver instant corrective feedback and adjust difficulty in real-time, leading to improved grammatical competence and higher learner engagement. Furthermore, gamification and interactive visuals can make learning grammar rules more enjoyable, turning a traditionally dry subject into an engaging activity [4]. By combining a **graphical user interface** with intelligent algorithms, a learning platform can visually demonstrate grammar concepts (for example, diagramming sentences or highlighting parts of speech in different colors) and allow learners to experiment and learn through discovery. This learner-centric approach aligns with modern pedagogical emphasis on active learning, where students learn by doing and receiving feedback, rather than just reading or listening. In summary, there is a pressing need for an **innovative grammar learning interface** that utilizes AI for personalization and feedback, and a graphical, interactive design for enhanced engagement. The system presented in this paper is an attempt to fulfill this need by marrying **state-of-the-art AI techniques** with user-friendly visual learning tools to create a more effective English grammar learning experience.

## 2. SYSTEM ARCHITECTURE AND FEATURES

### 2.1 Core Technologies

The proposed grammar learning platform is built on a modular architecture that integrates several core AI and software technologies. Figure 1 provides an overview of the system's architecture, highlighting the key components and their interactions. At the heart of the system is a Natural Language Processing (NLP) module, which analyzes user input (e.g. sentences constructed by the learner) to detect grammatical errors and parse sentence structure. This NLP module leverages a combination of rule-based grammar checkers and AI-driven language models to accurately identify issues and provide context-aware suggestions. Complementing the NLP engine is a Machine Learning component responsible for personalization; it uses user performance data to adapt the difficulty level of exercises and to predict which grammar topics require more practice for each learner. The platform also includes a Content Generation engine powered by AI – this engine can dynamically create new grammar exercises or sentences for practice, ensuring a virtually unlimited and varied question bank. A User Modeling subsystem tracks each learner's progress, recording metrics such as topics mastered, common errors, and response times. This data feeds back into the ML adaptive system to tailor subsequent exercises. On the front end, the system employs modern web and graphics technologies to deliver a responsive, engaging Graphical User Interface (GUI). The GUI allows for interactive manipulation of sentence elements (for example, dragging words into the correct order) and provides visual cues (such as highlighting incorrect parts of a sentence in red, or displaying grammar rules in callout boxes). The platform is implemented as a web-based application for broad accessibility, using frameworks compatible with multiple devices (desktop, tablet, and mobile). Key technologies and components of the system are summarized below:

- **Grammar Analysis NLP Engine:** Uses AI Agents as parsers which are pretrained language models to detect grammatical errors and analyze sentence structure in real time. It supports understanding learner input and generating corrections or hints.
- **Adaptive Learning Module:** Another AI Agent which uses Machine learning algorithms that adjust the difficulty and topic of exercises based on the learner's performance. It employs techniques like reinforcement learning to recommend practice on weak areas and to progressively challenge the learner.
- **Exercise Generation:** AI-driven content creation that produces new sentences or quizzes on the fly. This module ensures variety in practice material and can focus on specific grammar points (e.g., tenses, prepositions) depending on the learner's needs.
- **User Progress Tracker:** A database and analytic layer that stores user profiles, progress metrics, and achievements. It enables progress visualization and helps the system personalize the learning path for each user.
- **User Interface & Visualization:** An interactive graphical interface built with user-friendly design principles. It includes visual elements such as grammar diagrams, drag-and-drop sentence building tools, and immediate pop-up feedback indicators. The interface design follows accessibility standards, ensuring that visualizations (colours, fonts, layout) are clear and helpful for learning.

These core technologies work in concert to create a seamless learning experience. For instance, when a learner attempts an exercise, the NLP engine evaluates the response and the UI instantly marks errors and displays hints; simultaneously, the user model updates the learner's profile and the adaptive module decides what exercise to present next. This real-time interplay is what enables the platform to function as an intelligent tutoring system for English grammar, offering some of the same benefits as one-on-one tutoring by a human instructor [2][3].

### 2.2 Platform Capabilities

Building on the core technologies, the AI-based graphical learning interface offers a suite of features aimed at

maximizing educational effectiveness and user engagement. Table 1 provides a comparison of traditional grammar learning methods versus the capabilities of our proposed system. The key platform capabilities are highlighted below:

- **Interactive Visual Exercises:** Learners engage with grammar exercises in a visual format. For example, a sentence scramble exercise allows users to reorder jumbled words into a correct sentence by dragging word tiles on the screen, providing a hands-on understanding of syntax. Visual diagrams (such as parse trees or highlighted subject-verb pairs) illustrate grammar rules in action, helping learners grasp abstract concepts through images and animation.
- **Real-Time Feedback and Hints:** The system provides instantaneous feedback on user input. If a learner makes a grammatical error, the interface immediately highlights the error and the AI offers a hint or explanation (e.g., “The verb tense is incorrect; consider using past tense for this context”). This mirrors the responsiveness of a human tutor by correcting mistakes at the moment of learning, which is crucial for reinforcing correct usage. The feedback can include brief explanations of the relevant grammar rule, turning each mistake into a learning opportunity.
- **Personalized Learning Path:** The AI adapts to the learner’s individual strengths and weaknesses. For instance, if the user consistently struggles with a particular grammar construct (such as conditional sentences or modal verbs), the system will automatically provide additional practice exercises focusing on that area. Conversely, topics that the learner excels in will appear less frequently, keeping the practice sessions efficient and tailored. This personalized curriculum is continuously refined by the user progress tracker and adaptive learning module.
- **Gamification and Motivation:** To maintain high engagement, the platform incorporates gamified elements. Learners can earn points or badges for completing exercises, achieve streaks for daily practice, and possibly compete on leaderboards (optionally, among classmates or a community, if applicable). The interface features a friendly mascot and positive reinforcement messages to create an encouraging learning atmosphere. By turning grammar practice into a game-like experience, the platform reduces anxiety around making mistakes and motivates users to practice more frequently.
- **Progress Tracking and Analytics:** Users have access to dashboards that visualize their progress over time. Metrics such as grammar quiz scores, improvement in error rates, and time spent on each topic are displayed in charts. This allows learners (and instructors, if the system is used in a classroom setting) to see measurable improvement and identify areas that need more work. The progress analytics also help validate the effectiveness of the system, as improvements in these metrics can be tracked for each individual.
- **Accessibility and Flexibility:** The graphical interface is designed to be accessible to learners of various ages and backgrounds. Clear typography, color-coded highlights, and intuitive drag-and-drop controls make it easy to use. The platform supports multiple device types and does not require specialized hardware – only an internet connection and a modern web browser. This flexibility means the tool can be used in classroom computer labs, on students’ home computers, or on tablets for learning on-the-go. Additionally, for learners with specific needs, the interface includes options like text-to-speech for instructions and exercises (to aid those with reading difficulties) and adjustable font sizes.

In summary, the platform is distinguished by its ability to provide **immediate, customized, and engaging** grammar practice. By addressing the pain points of traditional methods (such as delayed feedback and lack of engagement)

with AI-driven solutions, the system has the potential to significantly improve learning outcomes. Figure 1 illustrates the overall system design, and Table 1 contrasts key features of the traditional approach versus our AI-based approach.

**Figure 1.** System architecture of the AI-based graphical grammar learning platform.

**Table 1.** Comparison of Traditional Grammar Learning vs. AI-Based Grammar Learning Interface

| Aspect          | Traditional Method                                                    | AI-Based Interface                                                                             |
|-----------------|-----------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| Interaction     | Classroom lectures or static exercises. Learner largely passive.      | Interactive, graphical exercises with user participation. Learner actively constructs answers. |
| Feedback        | Delayed (homework graded later) or generic correct/incorrect answers. | Instant feedback with explanations and corrective hints for each attempt.                      |
| Personalization | One-size-fits-all content; same progression for all learners.         | Adaptive learning path tailored to individual proficiency and progress.                        |
| Content Variety | Fixed set of examples in textbooks or worksheets.                     | Dynamically generated exercises providing endless variety and context-specific examples.       |
| Engagement      | Often low; grammar drills can be tedious and abstract.                | High; game-like elements and visual aids make learning fun and concrete.                       |

### 3. IMPLEMENTATION AND EVALUATION

#### 3.1 Pilot Study and Feedback

A four-week pilot involved 20 intermediate ESL learners on whom the platform was used 30 minutes daily while a matched control group continued traditional study. Learners completed a pre- and post-grammar test and a short satisfaction survey. Average scores for the experimental group rose from 68 % to 85 %, while the control group improved modestly from 70 % to 75 % (see Chart 1). Survey responses showed that 90 % of participants valued the instant feedback and visual cues; teachers reported higher voluntary practice.

**Chart 1.** Pre-test and post-test grammar proficiency scores of learners using the AI-based platform vs. a control group

#### 4. CONCLUSIONS

The study shows that pairing AI-driven feedback with an interactive graphical interface significantly boosts grammar proficiency and learner engagement compared with traditional methods. Real-time corrections, adaptive practice, and game-like visuals transform grammar drills into an effective, motivating experience. While the pilot was small, the gains reported in Chart 1 and learner enthusiasm justify broader trials and further feature development (e.g., mini-lessons for persistent errors). As AI and UI design advance, such platforms can complement classroom teaching and make complex grammar concepts accessible to diverse learners.
